Landing Planes for 40 Years: Air Traffic Control (ATC)

Until the 1960s, coordinating aircraft at an airport was a manual operation. With more flights, cluttered radar screens and occasional accidents, the Federal Aviation Administration (FAA) realized it was time for a faster, more efficient system. They turned to UNIVAC who then developed the very first computerized air traffic control system. Developed in Minnesota, by UNIVAC engineers, the Automated Radar Terminal Control System (ARTS I) was installed in Atlanta, GA, in 1966.

UNIVAC and its successor companies continued to support Air Traffic Control (ATC) operations over the years. ARTS I was later replaced by ARTS III, which was rolled out in 1971. This was an incredibly reliable system (99.9%), which was designed to reconfigure failing units and resume ATC operations in ten seconds. While a number of operational enhancements were installed over the years, the core ATC system remained in place for over 40 years.

If you have flown any time since the late 50s, part of your flight has been under the control of systems developed by Remington Rand, Univac, etc.
